Hi

I'm **Anamoul Rouf**

anamoulrouf.bd@gmail.com https://anamoulrouf.com

About Me

Profile

I’m a Product Designer with more than 7 years of working experience building bridges between business, technology, and human.

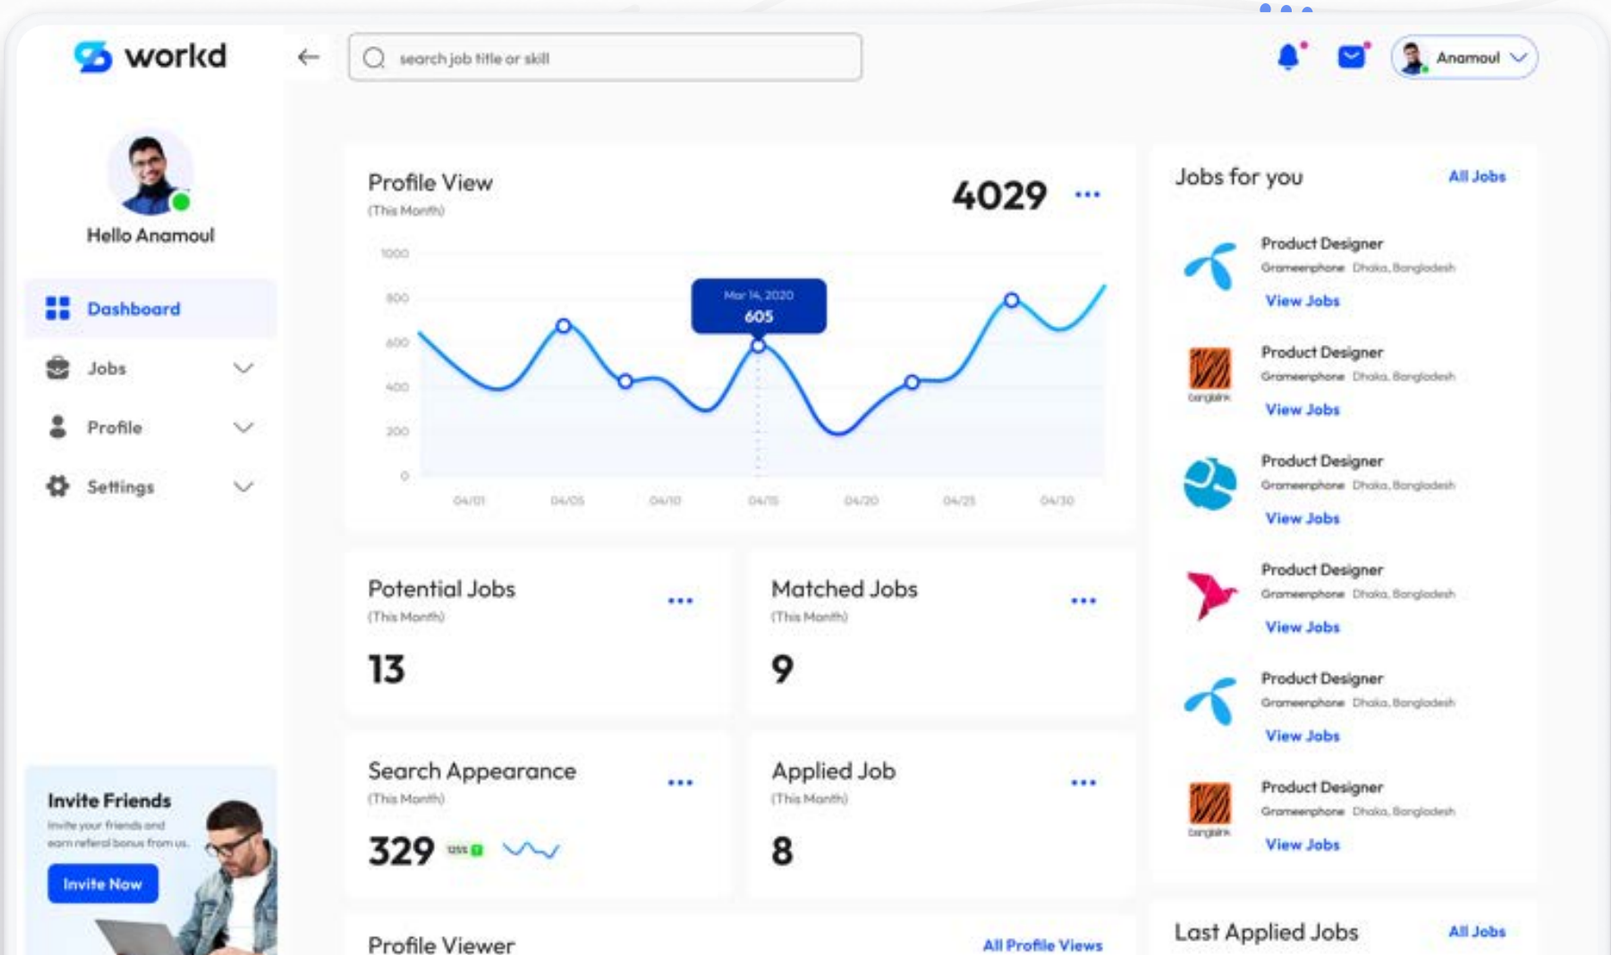

- I’ve helped startups and product-driven companies to build **7+ mobile apps, 10+ web applications**, and 25+ websites.
- I believe in design practice that is data-informed and driven by empathy.
- I’m passionate about balancing complex business requirements, and user needs through a user-centered design process.

Sample of the products and companies I have worked with:

ShareTrip · Truck Lagbe · Jobike · Curogram · workd · pimjo · Ayro UI · Lineicons · G&R · themexpert · Beatnik · BERGER Trusted Worldwide · BENGAL MEAT · BURGER KING BANGLADESH · banglalink

workd

A Solution for the **Job Seekers to Connect with Opportunities**

Design Candidate Panel from Scratch

Project

Workd Candidate Panel

Timeline

March 2020 – May 2020

Platform

Web application.

Tools

Figma, FigJam, Notion.

My Role

UX Research, UI/UX Design.

Team Collaboration

Product, Marketing, and Tech.

Background

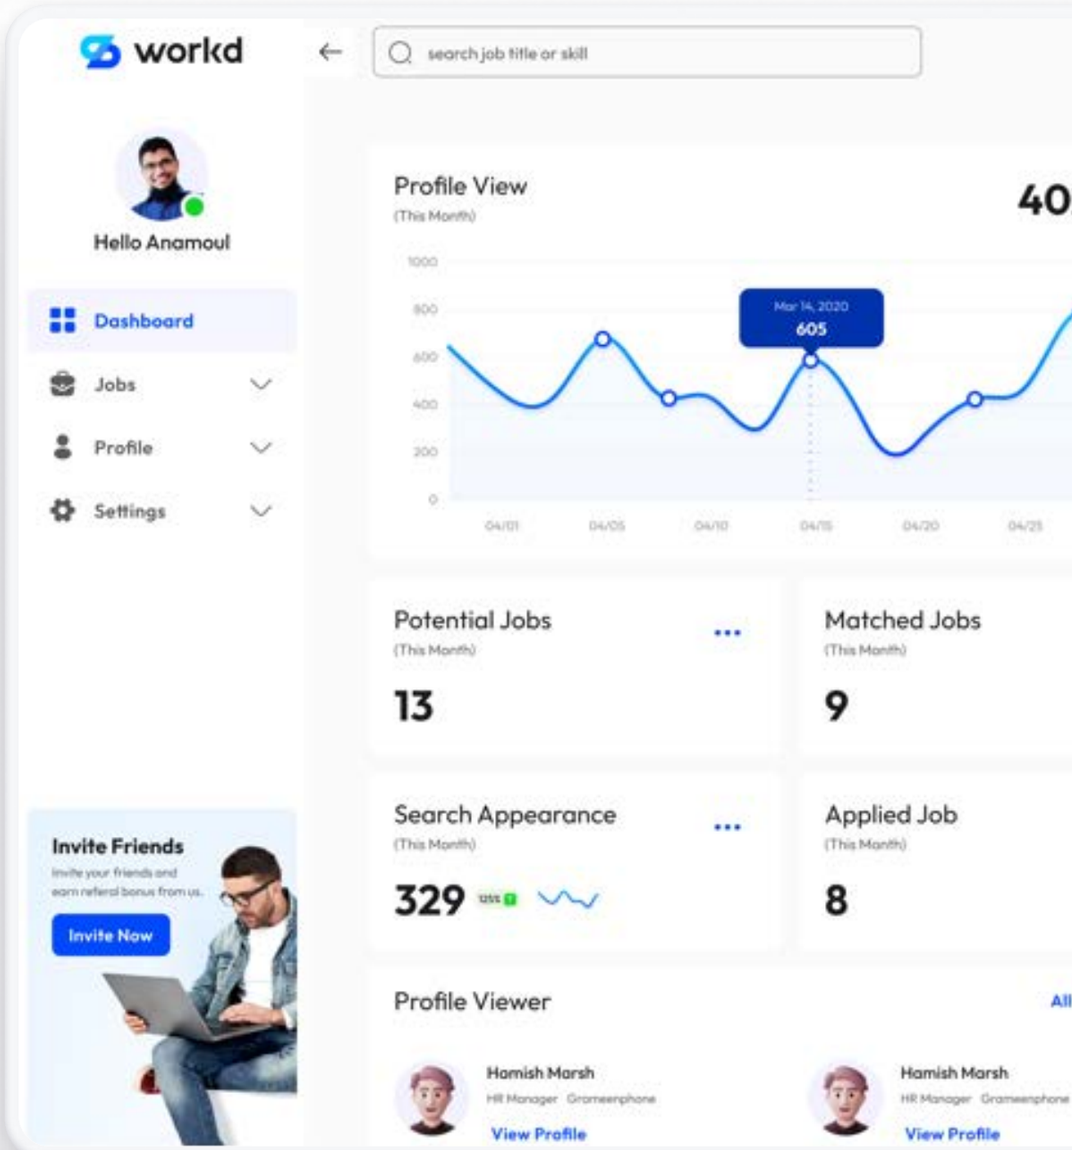

Workd is also a doorway to connecting job seekers with employers. Our main challenge is to design a portal that helps job seekers with career-changing opportunities.

Goal

- Design a conversion-friendly user flow.
- Get a more efficient, functional, and scalable job application process with more efficient, functional and scalable.

Outcome

- The number job applications was increassed by 45%.
- A job portal with more efficiency and functionality job search experience.

Design Challenge

Our main challenge was to design a portal for the candidates, where they can explore new opportunities, apply for them, and get hired by the employer.

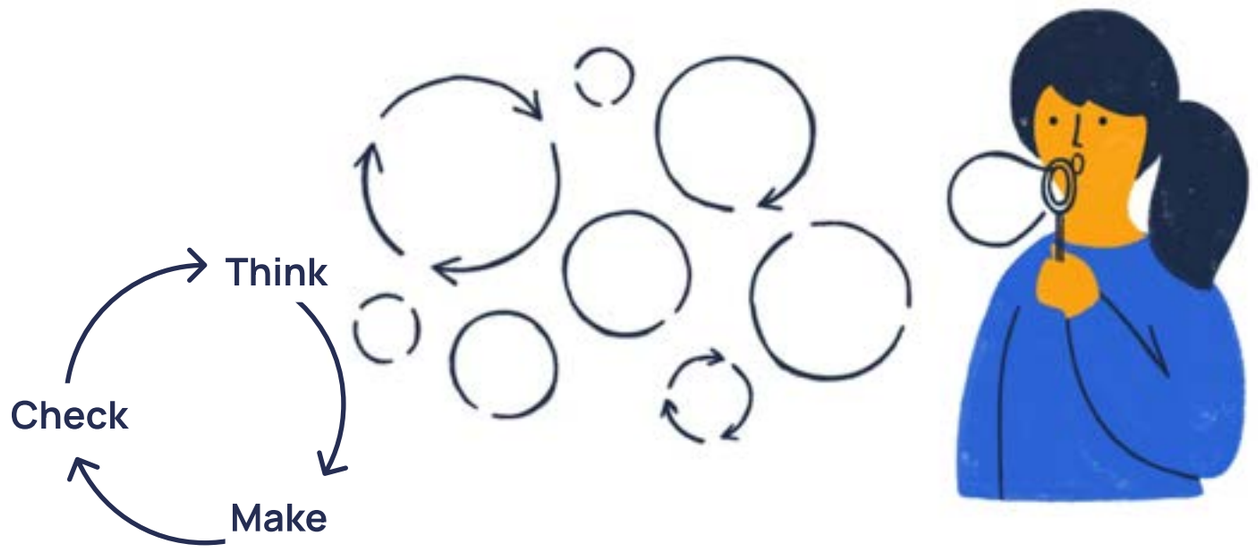

- It has to be easily used by the non-tech people.
- Candidates can get new relevant job posts notifications.
- Cadidates can get connected with the employer.
- Candidates can go through the hiring process and also get hired by the employer.

The UX Process

When we have minimal time and resources, selecting an efficient, sustainable, and flexible design process is always challenging. I have chosen the approach to the Lean UX process. It is an iterative process with three simple steps.

- Think
- Make
- Check

and keep repeating the steaps.

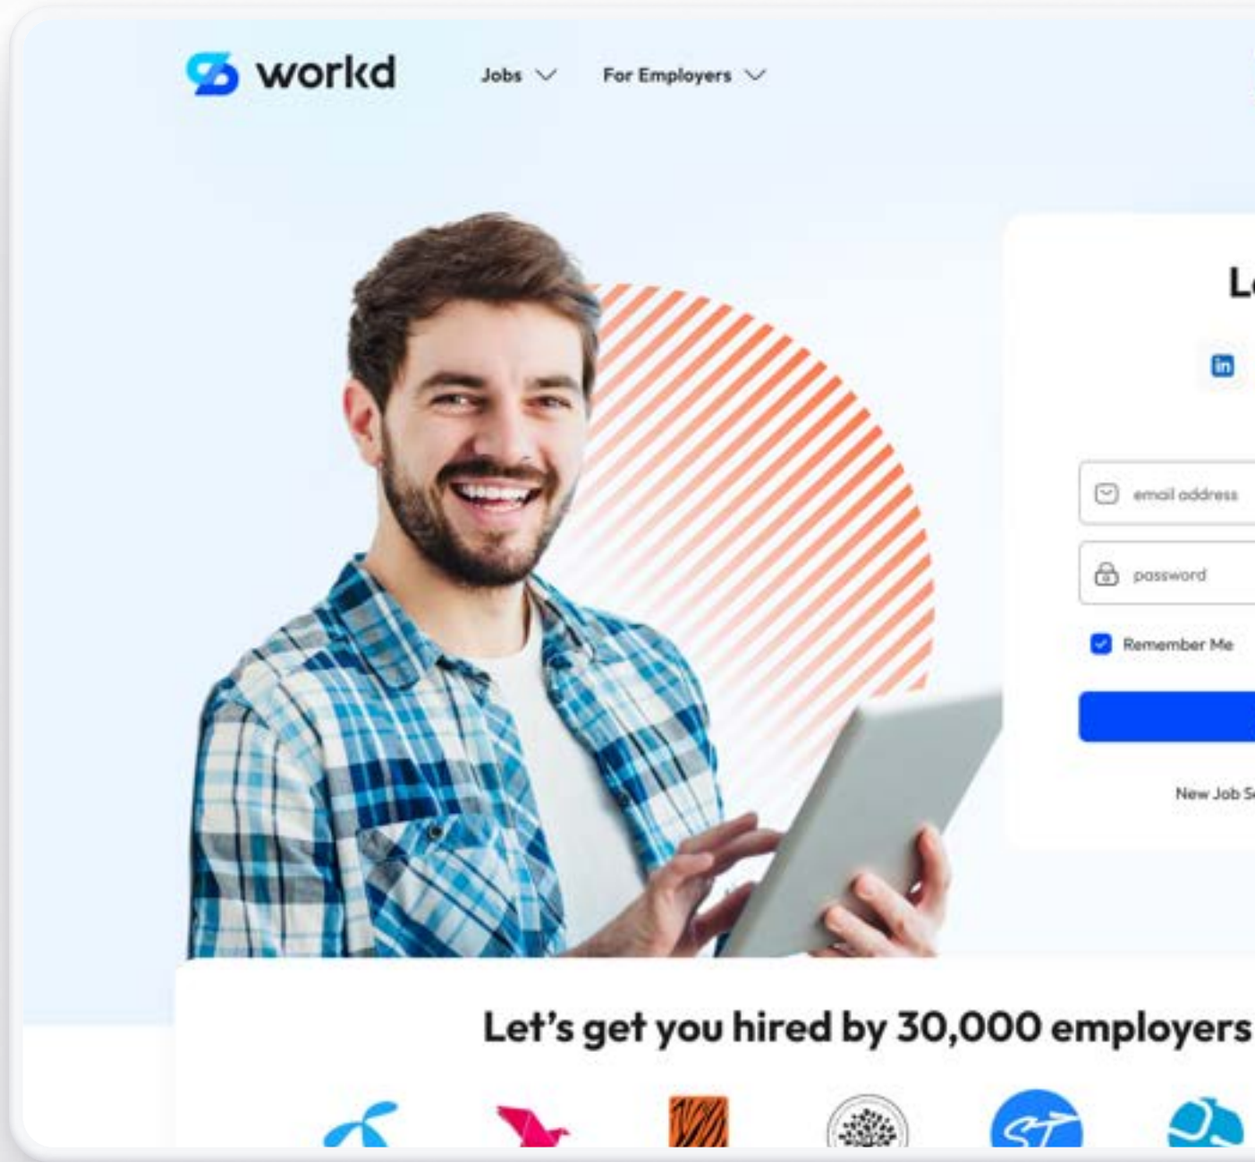

The Discovery

The discovery phase was a quick, high-intensity effort that allowed us to -

- Define project goals and milestones
- Audit the existing process faults
- Review the existing solutions by other similar products
- Understand business visions
- Empathize the users' needs, behaviors, and pain-points
- Understand technological feasibility and constraints.

Here are three considerations that help me to understand and prioritize the issues.

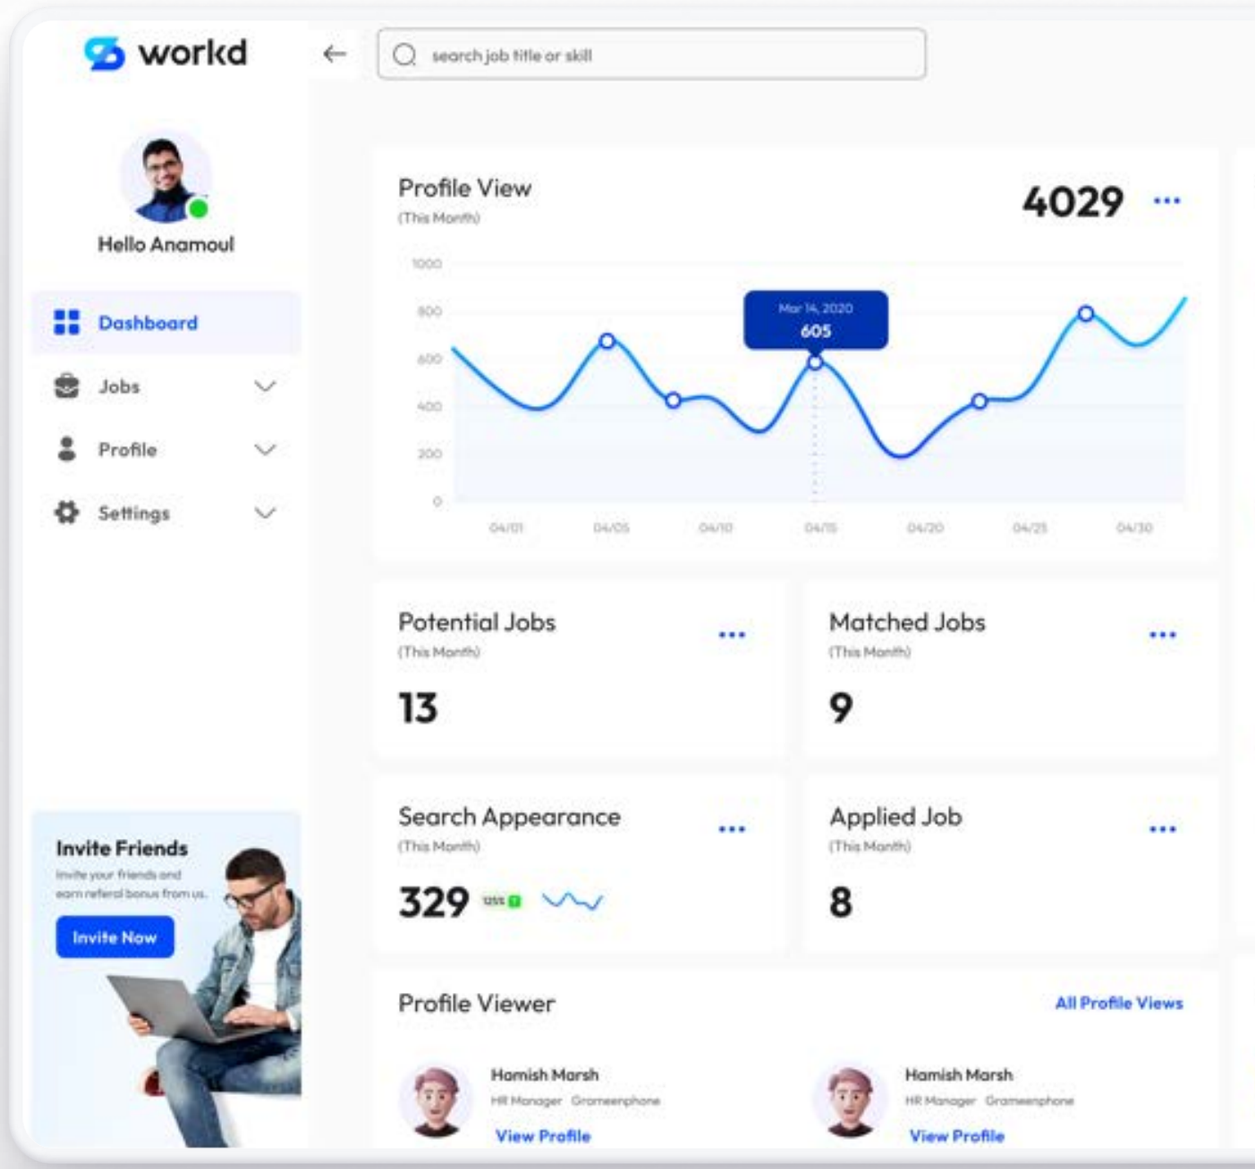

- How satisfying is the solution for users?
- How well is this solution for users' problem solving and also good for business?
- How challenging would it be to build from the technical feasibilities and limitations?

The Findings

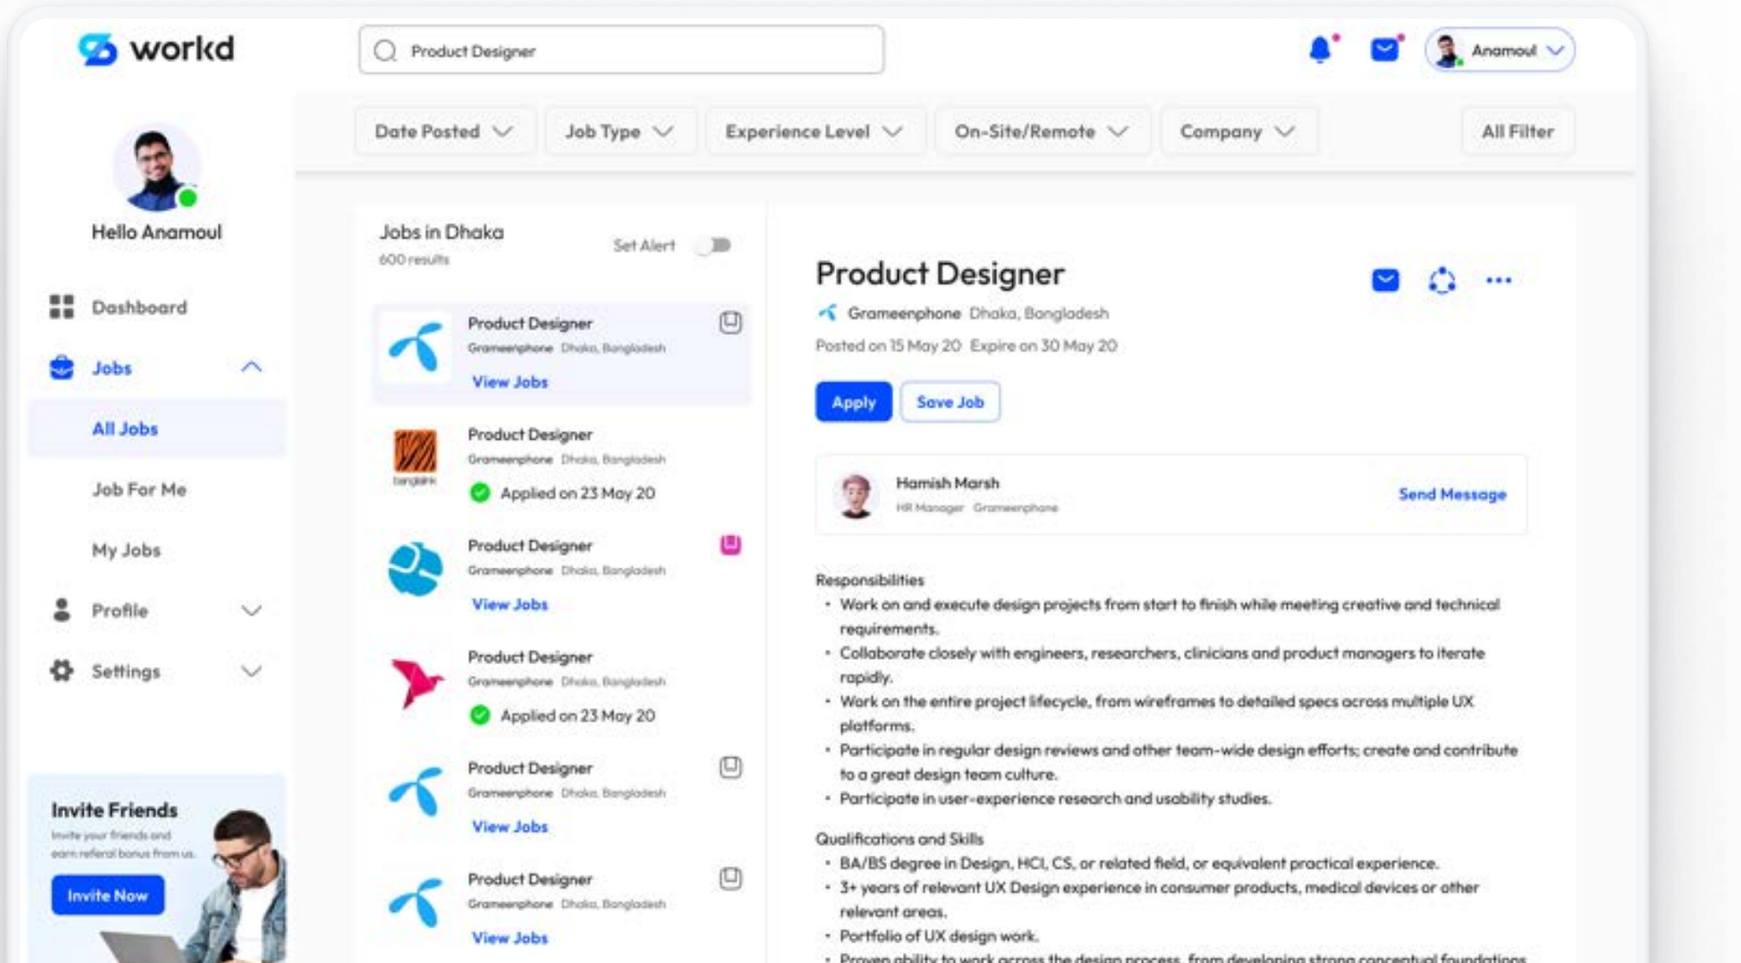

We have sessions with 10 job seekers and 3 employers. We also had brainstorming discussion sessions with our internal cross-functional team members. So what we found-

- The job seekers used different platforms to apply for jobs but 75-80% time they don't get a response.
- It is a hassle to fill up a lot of input fields when applying for a job.
- Uploading relevant attachments is time-consuming and very hassling for low-speed internet connectivity.
- It is hard to reach the hiring team or company and also get informed on the hiring process.
- The employers get the applications from different platforms and 80-85% time they get irrelevant candidates.
- It hassles to sort out and organize the best candidates from a huge number of applicants. Also, automate the hiring process.

The Competitive Analysis

I analyzed BDJobs, LinkedIn, Glassdoor, Indeed, and other popular hiring platforms. I analyzed their user journey flows, job application process and the hiring process.

The Process

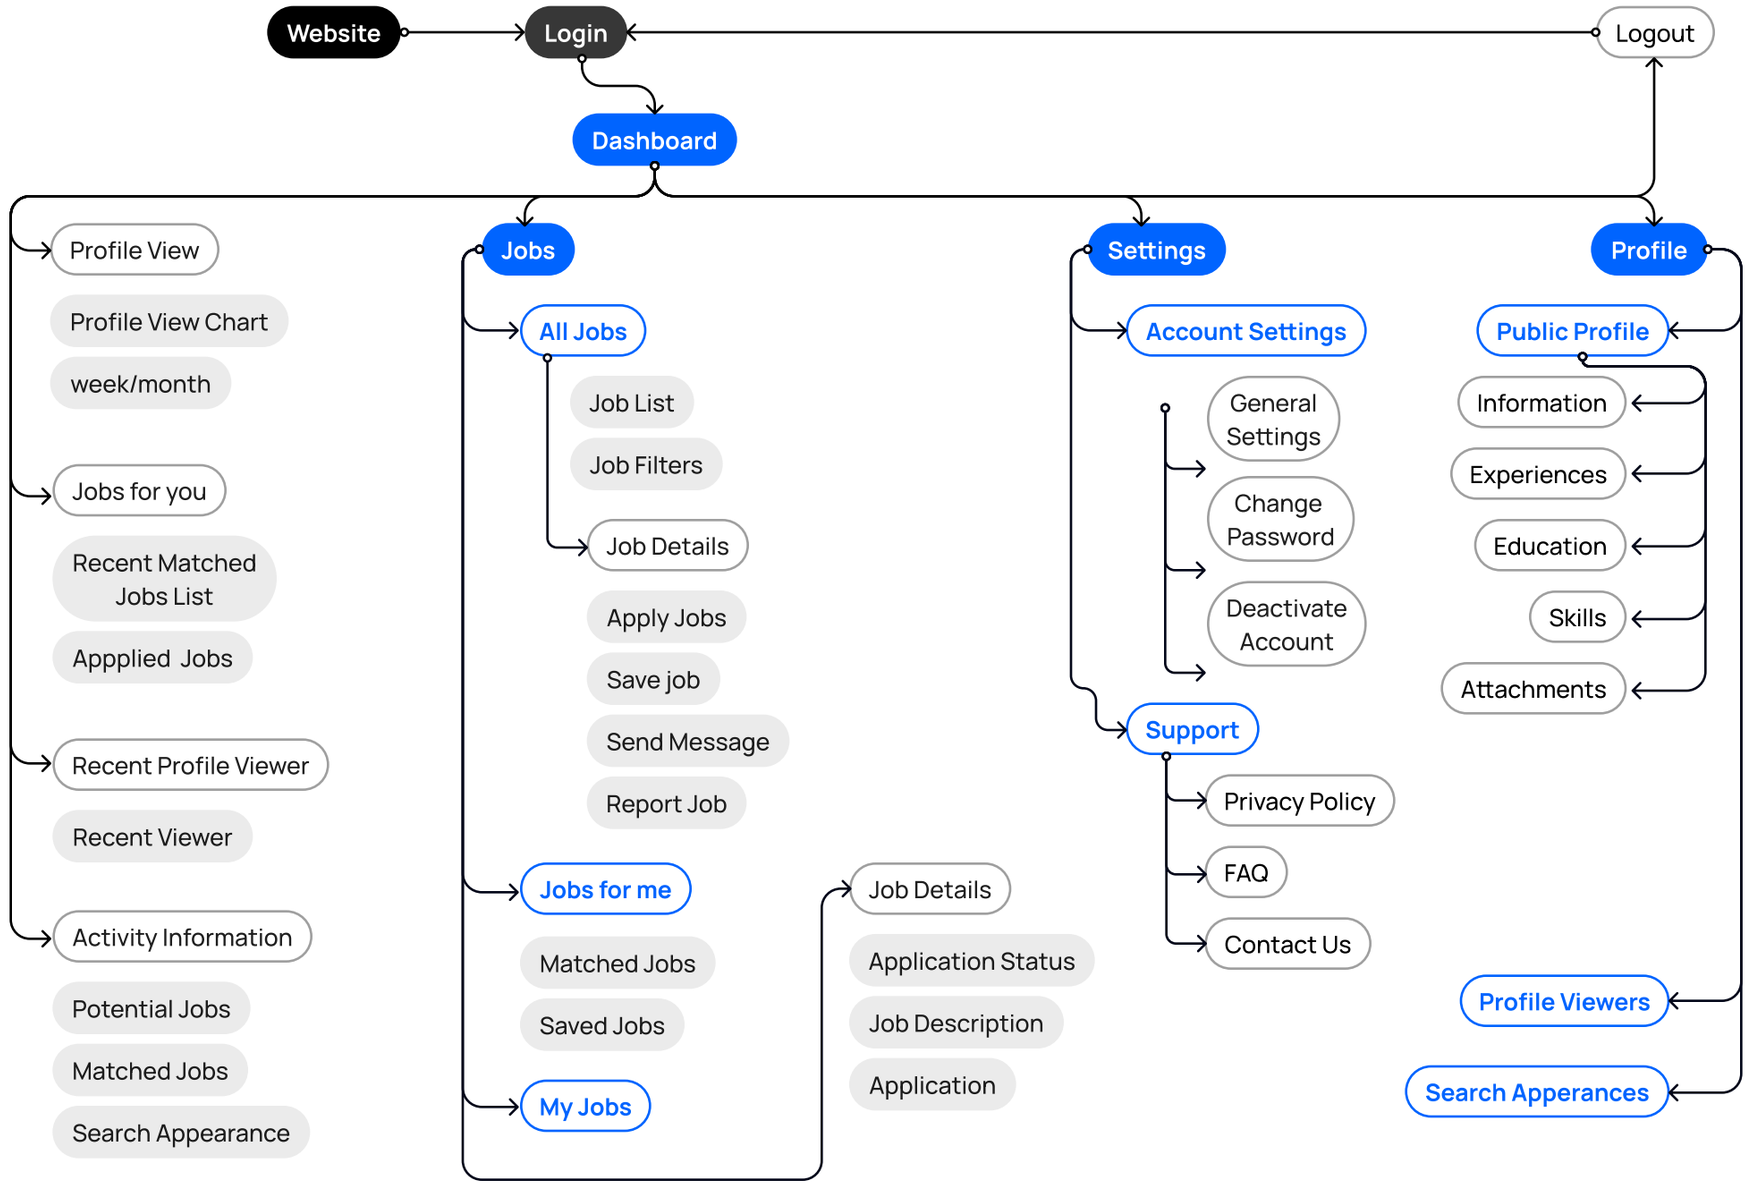

Journey

Main Screen

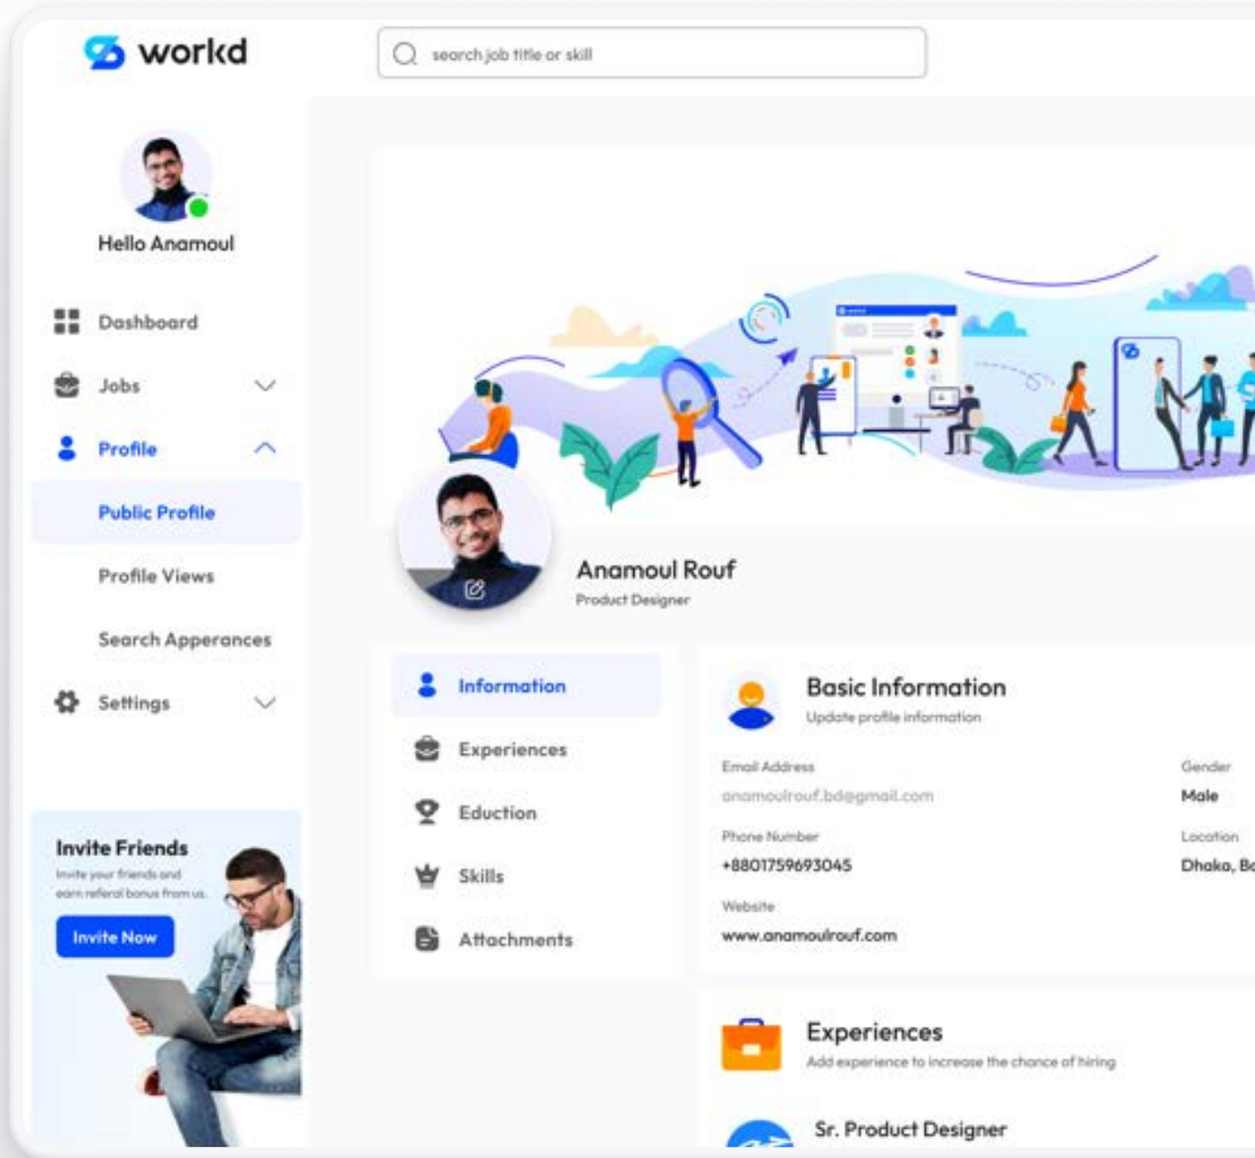

Sub Screen

Sketchs, Wireframing and Testing

The following steps were to sketch wireframes based on the user flow maps and built the flow and low-fidelity prototype for a series of testing sessions.

- Creating wireframes helped me to visualize the ideas and gave us the basic structure for how users would use the app.
- When creating these wireframes, we kept the user needs from the earlier findings and research in mind.
- I have done several testing sessions with a close group of users.

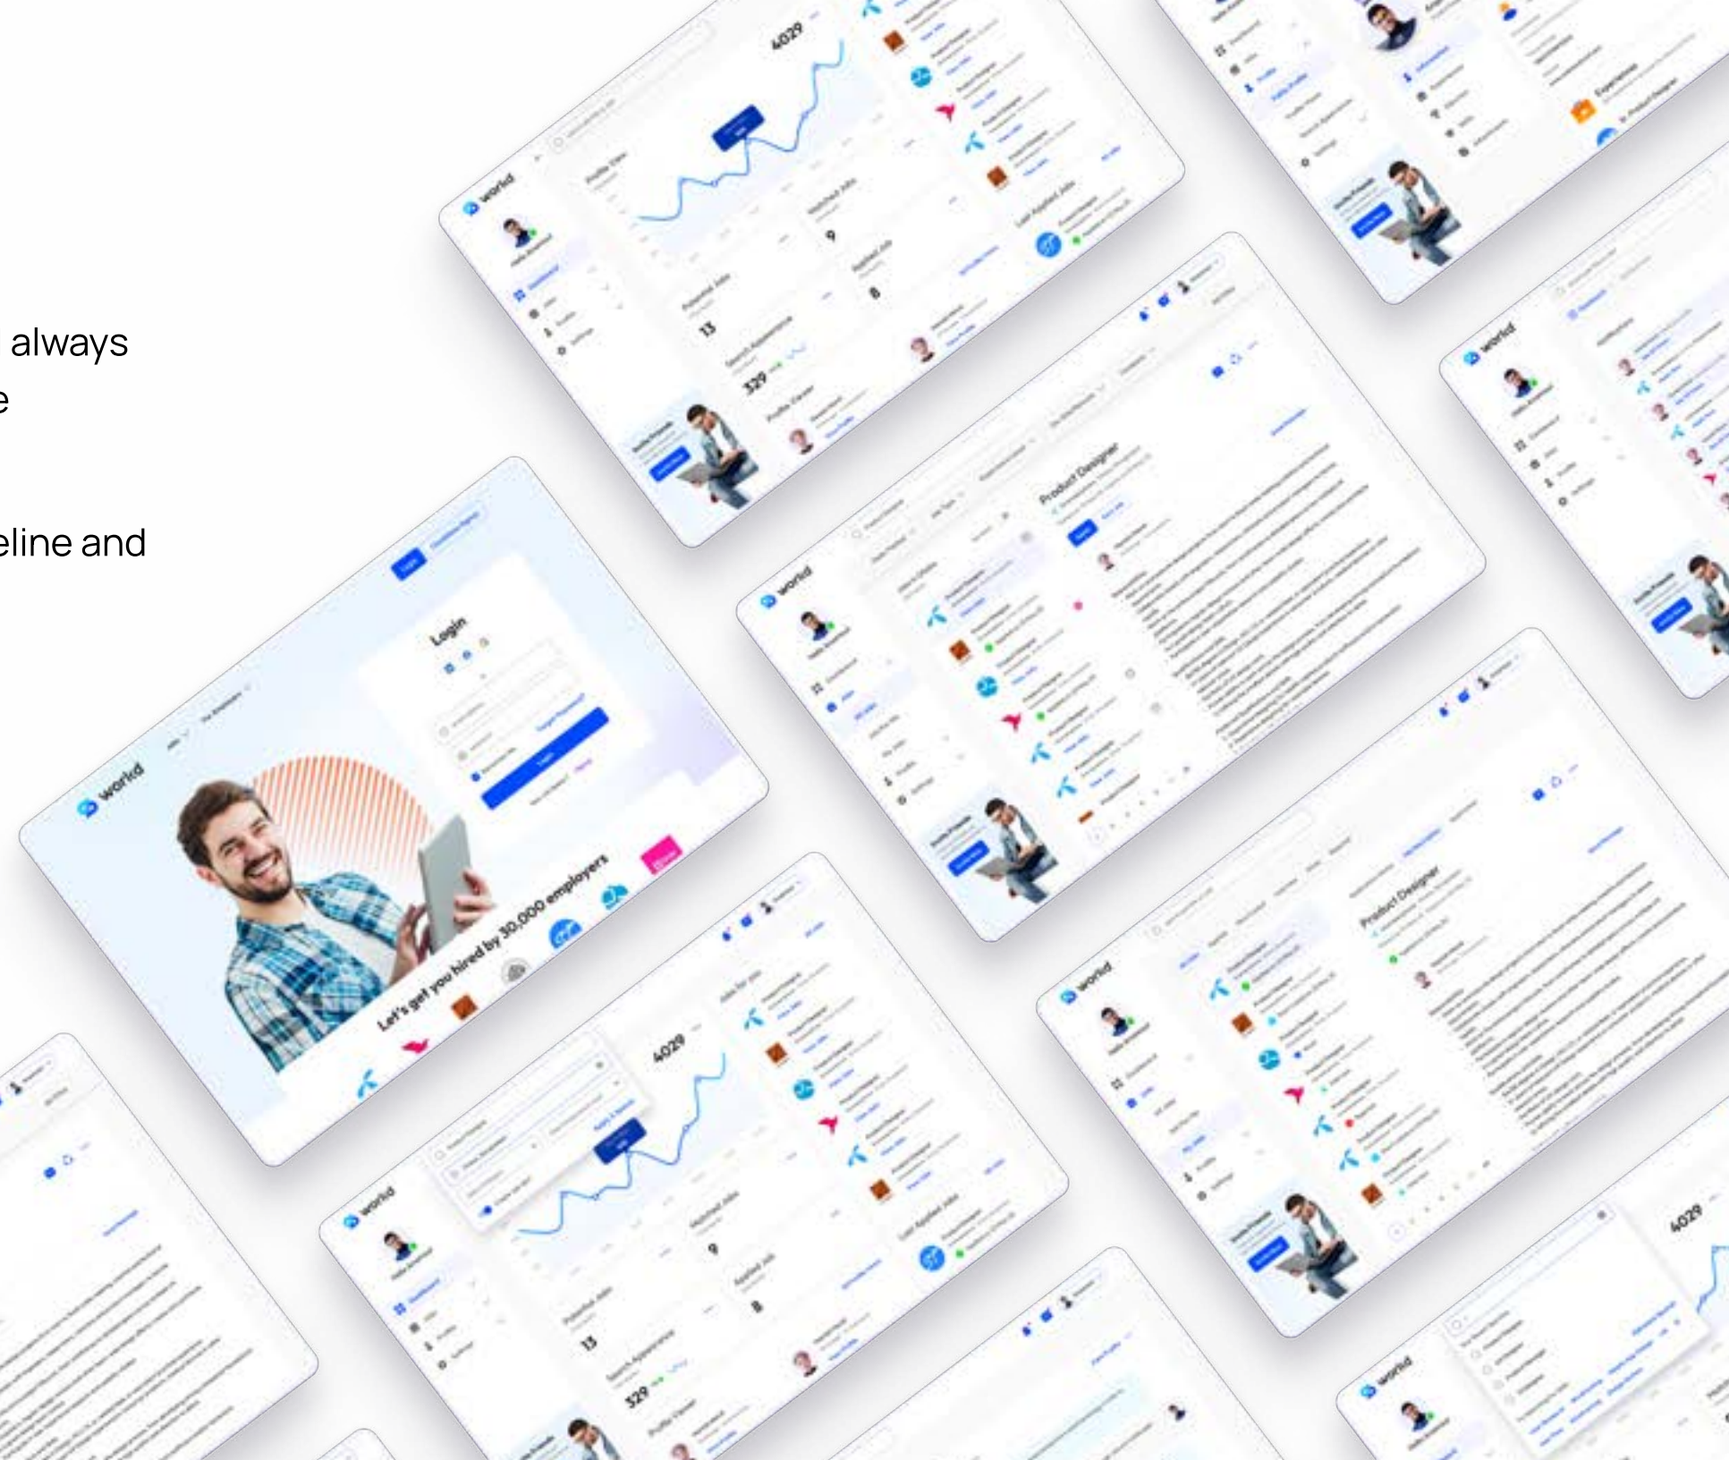

UI Design

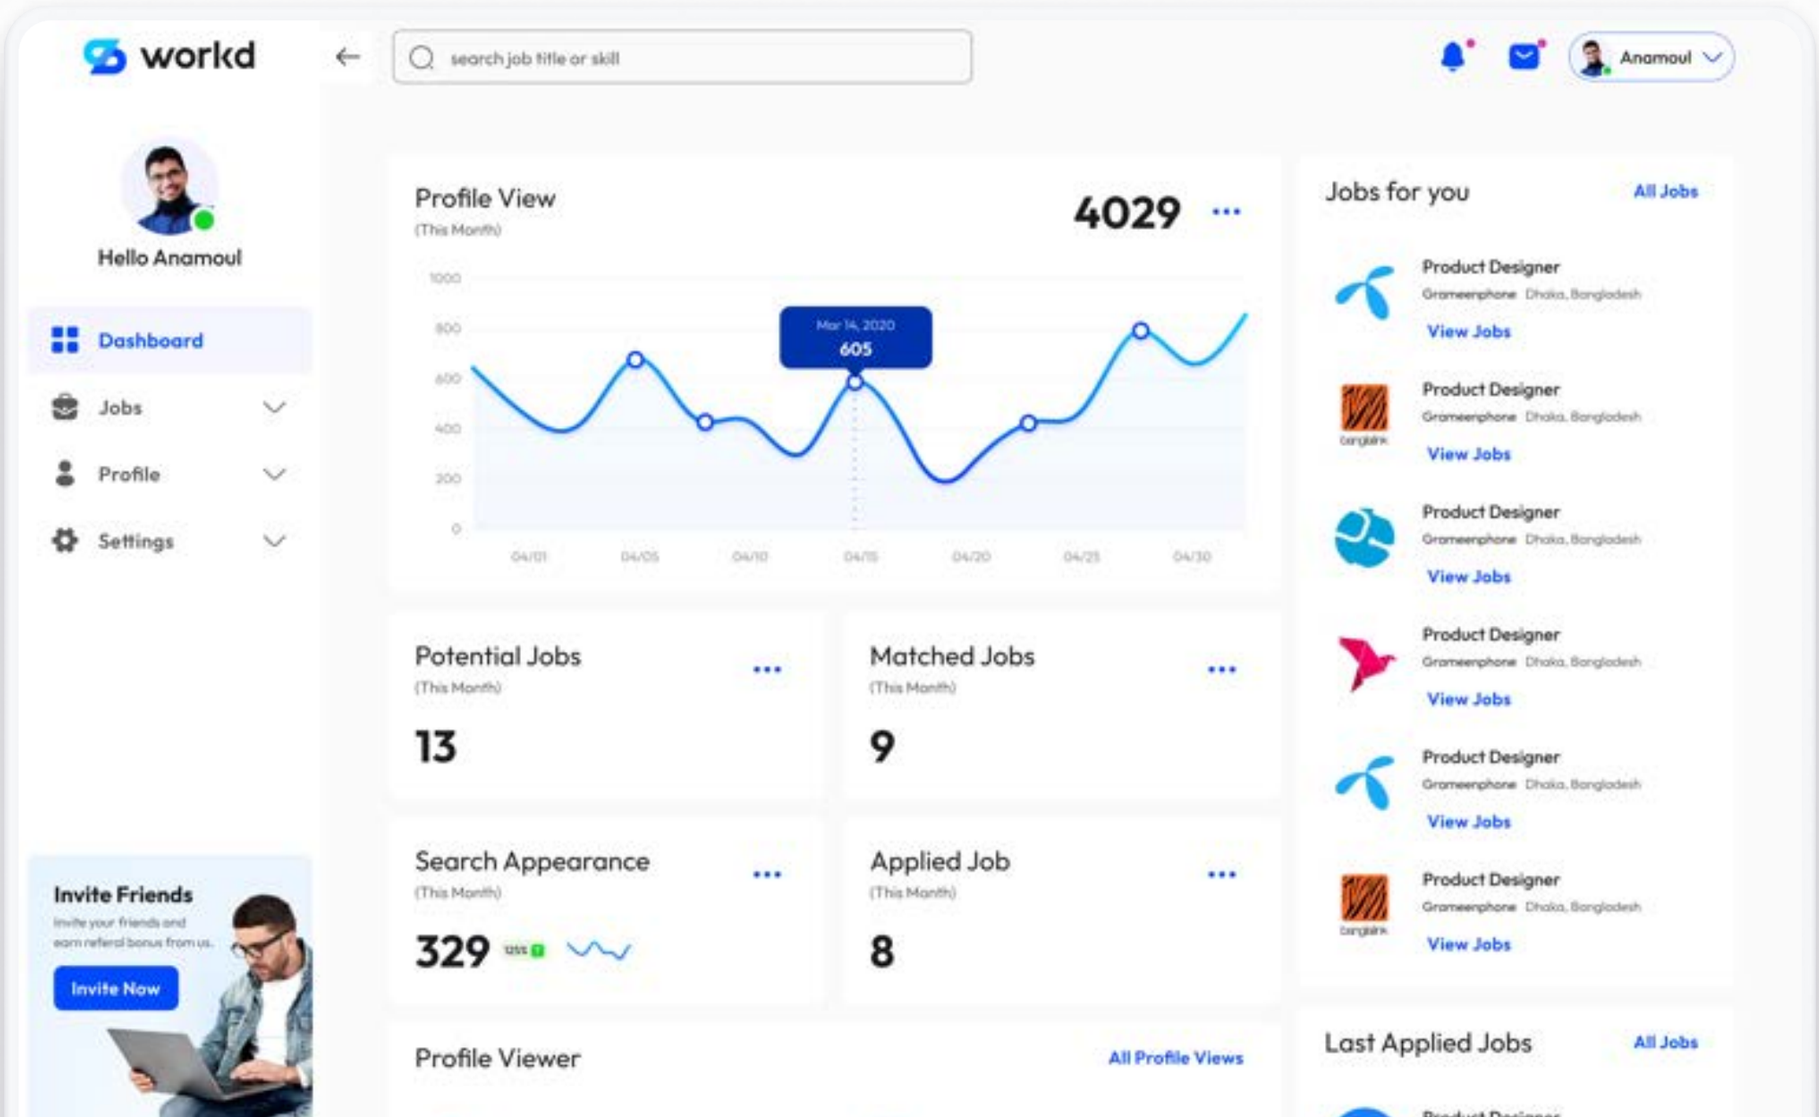

Before starting the UI design process, I always built a highly customizable design style guideline and reusable components.

- I have designed a design style guideline and reusable components.

Usability Testing

The goal was to assess the app's overall usability and identify areas for improvements that could facilitate the completion of the tasks. The participants were given the same set of jobs.

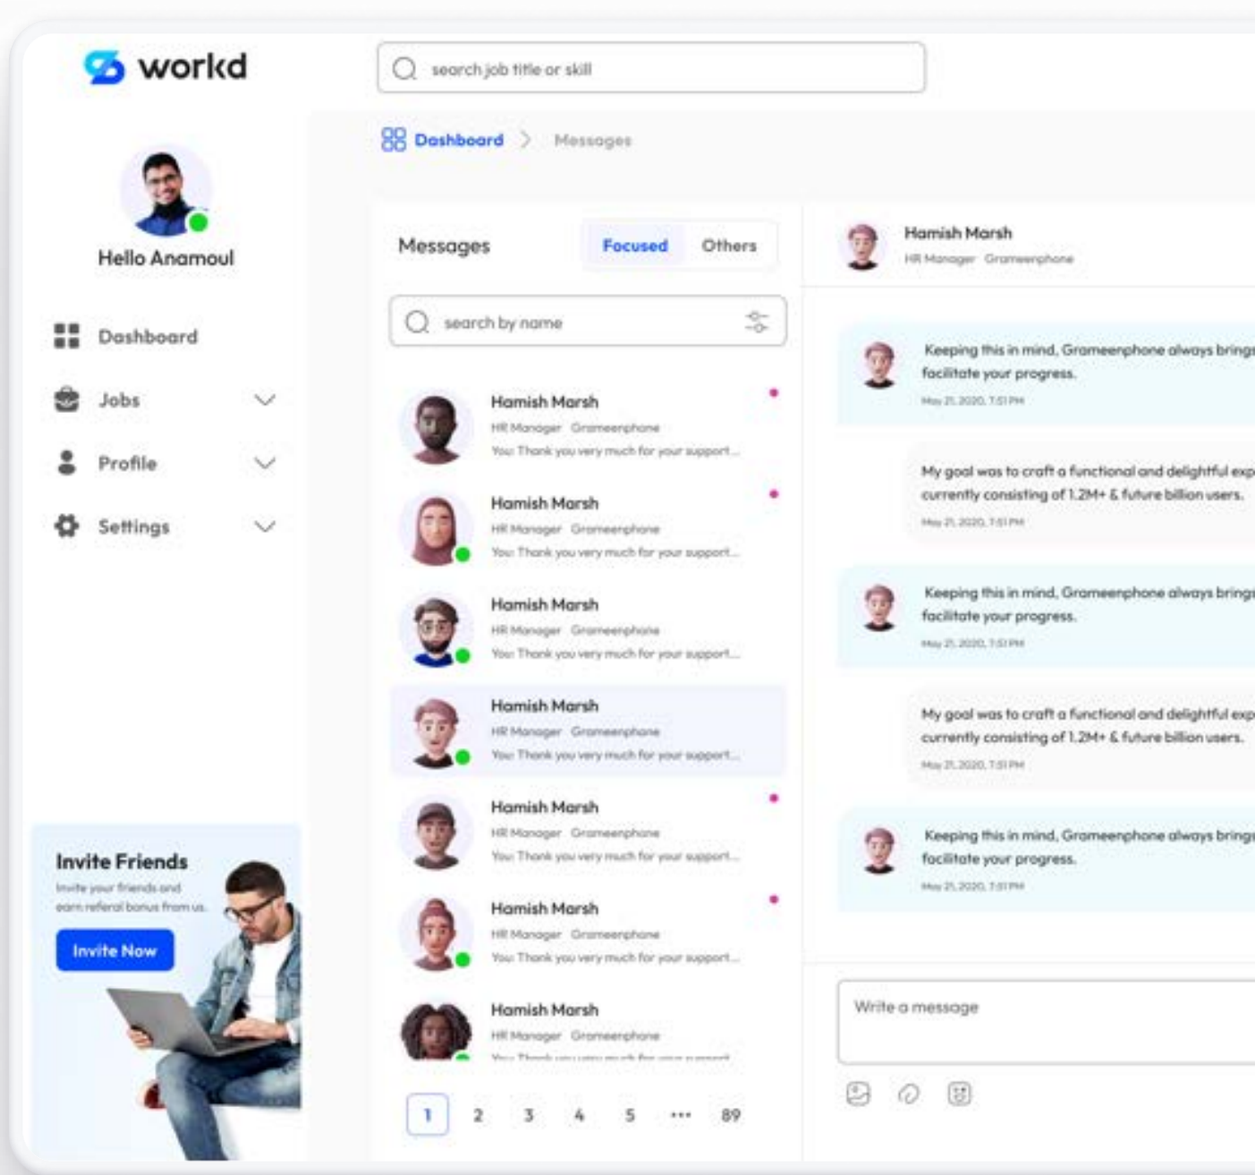

Due to the NDA issue, I've only shared the information authorized by the authority.

Refine & Deploy

Based on the usability testing sessions, we refined and updated the design. Then, we created deliverables for development handover. I maintained continuous communication with the developers during the development period.

After the successful deployment, it is time to collect feedback from the user.

Results & Future Iteration

We've monitored and measured the results for the first 6 months.

- The number job applications success rate was **increassed by 35%**.
- A job portal with more efficiency and functionality job search experience.

Thank you
